BEROSORI I	
LOCUS	BE809033 518 bp mRNA linear EST 25-APR-2001
DEFINITION	214373 MARC 2BOV Bos taurus cDNA 5', mRNA sequence.
ACCESSION	BE809033
VERSION	BE809033.1 GI:10240145
KEYWORDS	EST.
SOURCE	Bos taurus (cow)
ORGANISM	Bos taurus
	Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
	Mammalia; Eutheria; Cetartiodactyla; Ruminantia; Pecora; Bovoidea;
	Bovidae; Bovinae; Bos.
REFERENCE	1 (bases 1 to 518)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerication domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human cartiage oligomeric matrix protein (COMP) pentamerisation domain, a camel IgG Colsundario and the carboxy-terminal sequence KDEL. The subsequence disulphide bonds.

                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses the use of KDEL receptor inhibitor to promote GC secretion of proteins that are normally retained within the cell such as C heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and as taromytoma, with defective tumour suppressor genes, oncogenes, clifectious diseases, allergy or autoimmune diseases. The present equence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human cleavable signal peptide; the oligomerisation domain of human clearation of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human thrombospondin 3 (7593) trimerisation domain; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.

The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor protein comprising regions including a cleavable signal peptide; the oligomerisation domain from rat cartilage oligomeric matrix protein (COMP); a camel IGG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat COMP which provides increased stability via disulphide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibitors of the KDEL receptor which comprises an oligomerization domain useful for promoting secretion of proteins which are normal retained within the cell

The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such

The present sequence encodes KDEL receptor inhibitor comprising regions encoding cleavable signal peptide; a myc-tag; an N-glycosylation sequence; the oligomerisation domain of rat cartilage oligomeric matrix proteain (COMP); a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat COMP which provide increased stability via disulphide bonds.
Inhibitors of the KDEL receptor which comprises an oligomerization domain useful for promoting secretion of proteins which are normally retained within the cell -

The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromycoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor protein comprising regions including a cleavable signal peptide; the oligomerisation domain from rat cartilage oligomeric matrix protein; a camel IgG linker domain and the carboxy-terminal sequence KDEL.
                                                                                                                                                                                                                                                                                                                                                KDEL receptor inhibitor; heat shock protein; immune response; oligomerisation domain; neoplasia; sarcoma; lymphoma; leukaem melanoma; carcinoma; glioblastoma; astromytoma; oncogene; infectious disease; allergy; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several
                                                                                                                               Domain
                                                                                                                                                                                         Domain

The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of Xenopus thrombospondin 4 (TSP4) trimerisation domain including an additional subsequence; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several
                                                                                                                                                                                               oligomerisation domain; neoplasia; sarcoma; lymphoma; leu melanoma; carcinoma; glioblastoma; astromytoma; oncogene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The patent discloses the use of KDEL receptor inhibitor to promote CC secretion of proteins that are normally retained within the cell such as CC heat shock proteins by inhibiting KDEL receptor-mediated return of CC protein complexes to endoplasmic reticulum. This makes the secreted heat Shock proteins more accessible to the immune system and improves immune CC response to a target antigen. The inhibitor protein comprises several CC subunits where each subunit comprises an oligomerisation domain and has CC target antigen may be associated with diseases including neoplasia such CC as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and CC astromytoma, with defective tumour suppressor genes, oncogenes, CC infectious diseases, allergy or autoimmune diseases. The present CC sequence is KDEL receptor inhibitor comprising regions encoding a CC cleavable signal peptide; the oligomerisation domain of mouse CC thrombospondin 3 (TSP3) trimerisation domain including an additional CC subsequence; a camel IGG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

Shock proteins more accessible to the immune system and improves immune cresponse to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of mouse thrombospondin 3 (TSP3) trimerisation domain; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.

This makes the secreted heat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibitors of the KDEL receptor which comprises an oligomerization domain useful for promoting secretion of proteins which are normal retained within the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2000-195296/17.

                                                                                                                         The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human phospholamban (PLB) pentamerisation domain; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides of increased stability via disulphide bonds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..당
                                         the second and third type 1 repeats of human TSP (thrombospondin)-1,

but not the TGF (transforming growth factor)-beta activation region

of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing

the second and third type-1 repeats and the COMP (cartilage

oligomeric matrix protein) assembly sequence (COMP/TSP-1) was

produced by PCR (polymerase chain reaction). Expression of COMP/TSP-1

caused inhibition of the growth of tumours in mice models.

Thus the nucleic acids and proteins may be useful for treating

angiogenesis related diseases such as cancer (by reducing the rate of

growth and size of tumours), arthritis, psoriasis, diabetic

retinopathy, corneal graft rejection, and glaucoma. They may also be

used for treating human immunodeficiency virus (HIV) infection.

Anti-angiogenic therapy has little toxicity, does not require the

therapeutic agent to enter tumour cells or cross the blood-brain

barrier, controls tumour growth independently of growth of

tumour cell heterogeneity, and does not induce drug resistance.
                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding chimeric proteins such as cartilage oligomeric matrix protein (COMP)/thrombospondins (TSP)-1 and 2, useful for inhibiting angiogenesis and treating diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2000-514823/46

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   뭉
                                                                                                                                                                                                                                                                                                     New nucleic acids are described which encode a protein comprising the second and third type I repeats of human TSP (thrombospondin)-1, but not the TGP (transforming growth factor)-beta activation region of but not the TGP (transforming growth factor)-beta activation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage coligomeric matrix protein) assembly sequence (COMP/TSP-1) was produced by PCR (polymerase chain reaction). Expression of COMP/TSP-1 caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful for treating can angiogenesis related diseases such as cancer (by reducing the rate of growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glaucoma. They may also be used for treating human immunodeficiency virus (HIV) infection. Anti-angiogenic therapy has little toxicity, does not require the therapeutic agent to enter tumour cells or cross the blood-brain controls tumour growth independently of growth of tumour cell heterogeneity, and does not induce drug resistance.
                                                                                                                                                             Query Match
